ACTIVITY: Verify the exterior angle property of a triangle, using different coloured sheets.

This activity reinforced the concept by explaining that the exterior angle of a triangle is equal to the sum of two opposite interior angles. In this hands-on activity, the students used a set of coloured sheets, scissors, ruler and protractor. Later they cut out their own triangles and exterior angles. Finally, they measured and verified the exterior angle property themselves by comparing the exterior angle with the sum of two opposite interior angles. Through this activity, they also got to know that many geometrical problems can be solved by applying this property of a triangle.

LAB ACTIVITY: To trace the path of light ray using glass slab and find the angle of deviation with a glass prism

Students performed the lab activity with glass slab and prism and were able to understand the phenomena of refraction of light through it along with the practical application of both the optical devices.

The main objective of the activity was to assess the theoretical and practical understanding of the students in the classroom, their creativity and willingness to learn skills. Students were able to relate their theoretical knowledge with the real world scenarios in their surroundings and their applications.
